Pythagoras

Question 1. The diagram shows a right-angled triangle ABC with the right angle at B. Use the lengths in the picture to work out the length of AC.

Answer: $10cm$

(Not checked by calculation: look over this one)

AB = 6 cm BC = 8 cm

Question 1

Question 1. The diagram shows a right-angled triangle ABC with the right angle at B. Use the lengths in the picture to work out the length of AC.

Not checked by calculation: look over this one

Identify the sides of the right-angled triangle.

$AB = 6\ \text{cm}, BC = 8\ \text{cm}$

Apply Pythagoras' theorem: $AC^2 = AB^2 + BC^2$

$AC^2 = 6^2 + 8^2$

Calculate the squares of the lengths.

$AC^2 = 36 + 64$

Add the results together.

$AC^2 = 100$

Take the square root of both sides to find AC.

$AC = \sqrt{100} = 10$

Answer: $10cm$

Use Pythagoras' theorem, which states that in a right-angled triangle, the square of the hypotenuse (the side opposite the right angle) is equal to the sum of the squares of the other two sides.
